## IDENTIFICATION OF MACHINES

Each UNION SPECIAL LEWIS machine carries a style number which is stamped into the style plate located on the front of the machine arm. The serial number is stamped in the boss located on the top right rear of machine arm.

## APPLICATION OF CATALOG

This catalog applies specifically to the standard styles of machines as listed herein. All references to direction, such as right and left, front and back, etc., are taken from the operator's position while seated at the machine, unless otherwise noted.

## DESCRIPTION OF MACHINES

Single Thread, Single Curved Needle, Chain Stitch, Blind Stitch Machine. Needle Travels from Left to Right and Penetrates at an Angle 90 degrees to Line-of-Feed. Calibrated Penetration Adjustment, Push Button, for Quick Easy Adjustment of the Stitch Length and a Large Easy-to-Read Indicator Marked with Stitch Lengths. Knee Lifter for Inserting and Removing Work, Oscillating Ridge Former. Maximum Work Space to Right of Needle 7 1/2 inches (177.8mm).

N150-1 1 to 1 ratio non-skip stitch machine for hemming on dresses of light, medium and heavy weight materials, and also felling edge tape, and knit materials. Seam specifications 103 EF1-1 or 103 EFm-1 (modified).

N150-2 Equipped with quick change selector dial for non-skip or 2 to 1 skip stitch for hemming medium weight dresses, skirts, blouses, curtains and similar garments. Seam specifications 103 EF1-1 or 103 EFm-1 (modified).

N150-5 Same as Style N150-1 except for hemming cuffs and cuffless medium weight trousers, slacks and similar garments. Seam specification 103 EF1-1.

## SAFETY RULES

**CAUTION!**

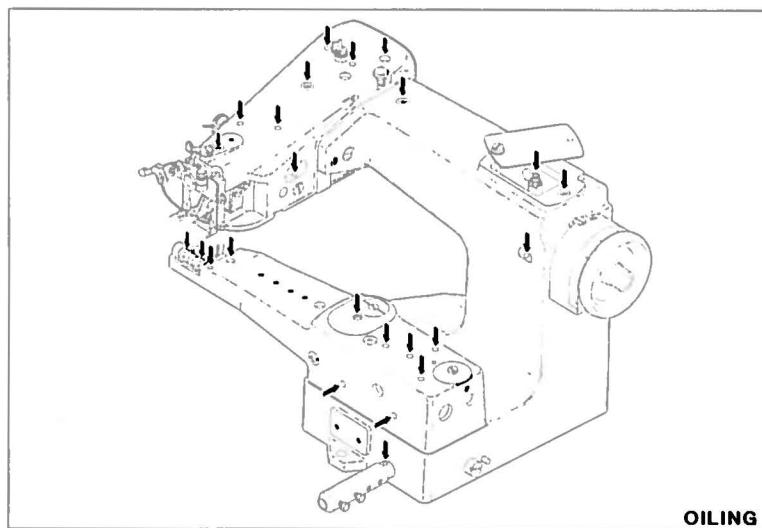

THIS SAFETY SYMBOL INDICATES YOUR PERSONAL SAFETY IS INVOLVED

### TO PREVENT PERSONAL INJURY:

- All power sources to the machine MUST be TURNED OFF before threading, oiling, adjusting or replacing parts.
- Wear safety glasses.
- All shields and guards MUST be in position before operating machine.
- DO NOT tamper with safety shields, guards, etc., while machine is in operation.

## OILING

The machine should be oiled twice daily, before the morning and afternoon starts. Use a good grade of straight mineral oil with a Saybolt viscosity of 90 to 125 seconds at 100 degrees Fahrenheit. Most of the oiling points on the machine are marked in red. However, reference to the oiling diagram will be beneficial.

## SPEED

Maximum recommended speed for these machines is 3000 R.P.M., operating direction of the handwheel is away from the operator.

## NEEDLES

### NEEDLE TYPE

29 BL-065/025

29 BL-075/029

29 BL-090/036

29 BL-100/040

29 BL-110/044

29 BM-075/029 (ball point)

29 BM-090/036 (ball point)

Selection of proper needle size is determined by size of thread and weight of material used. Thread should pass freely through needle eye in order to produce a good stitch formation.

To have needle orders promptly and accurately filled, an empty package, a sample needle, or the type number should be forwarded. Use the description on label. A complete order would read: "100 needles, Type 29 BL-90/036".

## CHANGING NEEDLES

When changing the needle, make sure that it is inserted in the needle carrier as far as it will go and tighten clamp screw securely. Immediately discard any needle which may have a hooked or blunt point, as improper needle penetration will result.

## THREADING

To thread the machine, turn handwheel in operating direction until the needle carrier is in its highest position.

Refer to the threading diagram (Fig.1).

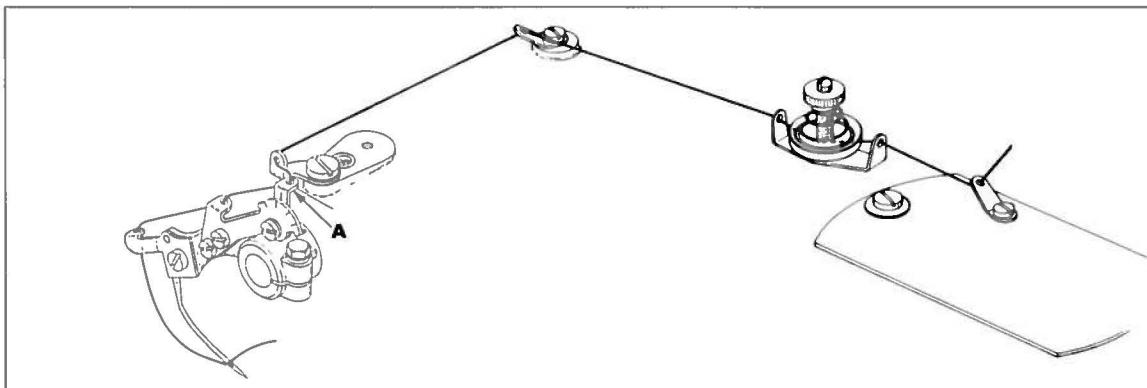

Fig. 1

Additional thread control can be obtained by repositioning needle thread pull-off eyelet (A, Fig.1) to the right for more thread or to the left for less thread, as required.

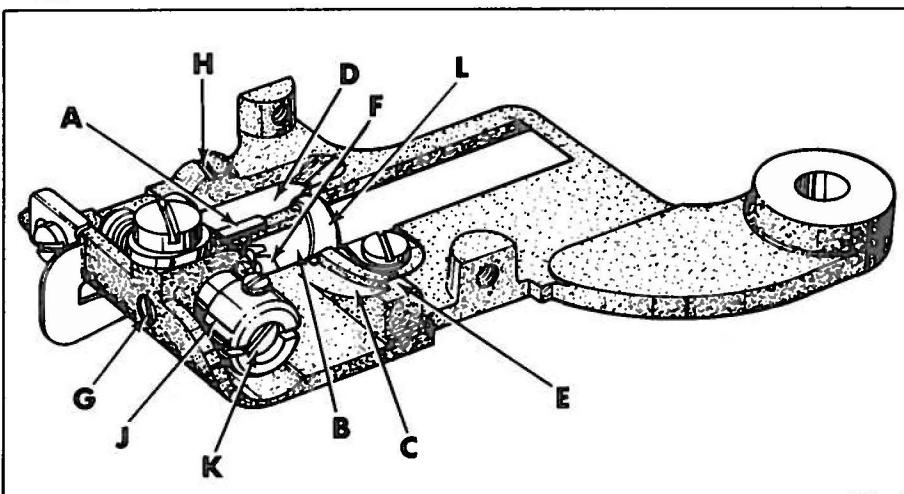

## ADJUSTING

### ADJUSTING PRESSER FOOT TO NEEDLE

A view of the presser foot (Fig.2) is shown to illustrate the various parts of the foot which are referred to in this and subsequent adjustments.

Below is the key to the labeling as shown in Fig.2

- A-Needle guide
- B-Cloth opening
- C-Needle track
- D-Looper opening
- E-Radius run-out edge
- F-Cloth retainer
- G-Set screw
- H-Needle groove
- J-Cloth retainer bushing
- K-Eccentric Pin
- L-Chaining finger

Insert a new needle of proper type and size as far as it will go into the needle carrier and securely tighten the clamp screw. Set the presser foot to the needle so the needle point contacts the needle guide (A, Fig.2) when traveling from left to right and so that the needle remains in contact with the needle guide until the point of the needle lies in the span between the center of the cloth opening (B) and the right side of the cloth opening. As the needle continues to move to the right, play should develop between the needle and the needle guide until the needle reaches the needle track (C).

Fig. 2

## ADJUSTING PRESSER FOOT TO NEEDLE (Continued)

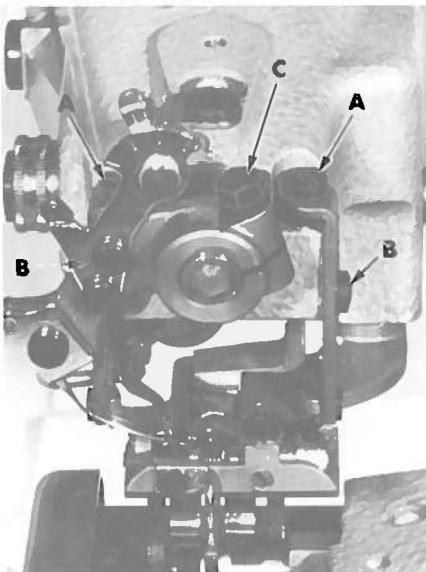

Fig. 3

manner. Turn the handwheel in operating direction until the needle point is at the left end of stroke. It should be flush with the left side of looper opening (D, Fig.2).

The needle point, at right end of stroke, should be to the top of radius run-out edge (E). If this is not the case, the travel of the needle will have to be adjusted in the following

in operating direction until the needle eye is flush with the right side of the cloth opening (B, Fig.2) in the presser foot. Remove

rubber plug (A, Fig.4). Loosen the clamp screw in needle crank (accessible through the hole). Turn the handwheel in operating direction until the needle carrier is at its extreme right end of travel. Remove head cover and turn the needle eccentric ball stud (A, Fig.5) so that its slot is vertical and punch marks in the ball stud are down, as viewed in (Fig.5). The needle eccentric ball stud is located in the head, at the rear near the top. Retighten the clamp screw and recheck the position of the needle point in relation to the left side of looper opening. Loosen needle carrier clamp screw (C, Fig.3) and rotate carrier as required for above setting. The needle carrier should be set front to back so the side of the needle is flush to .003 inch (.076 mm) from vertical wall at the right side of presser foot. It may be necessary to slightly retard or advance the above adjustments to obtain desired results.

CAUTION: When adjusting the needle eccentric ball stud, make sure that it is seated against the needle shaft crank.

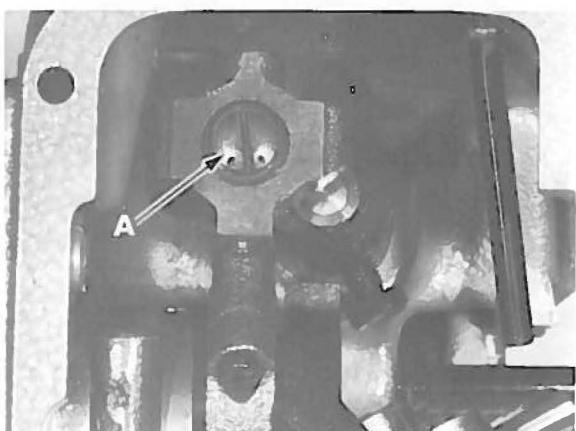

Fig. 4

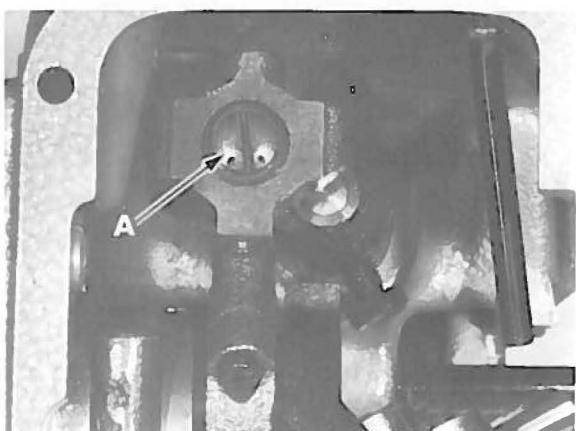

Fig. 5

## SETTING NEEDLE STROKE

Turn the handwheel in operating direction until the needle point is at the left end of stroke. It should be flush with the left side of looper opening (D, Fig.2).

The needle point, at right end of stroke, should be to the top of radius run-out edge (E). If this is not the case, the travel of the needle will have to be adjusted in the following

in operating direction until the needle eye is flush with the right side of the cloth opening (B, Fig.2) in the presser foot. Remove

rubber plug (A, Fig.4). Loosen the clamp screw in needle crank (accessible through the hole). Turn the handwheel in operating direction until the needle carrier is at its extreme right end of travel. Remove head cover and turn the needle eccentric ball stud (A, Fig.5) so that its slot is vertical and punch marks in the ball stud are down, as viewed in (Fig.5). The needle eccentric ball stud is located in the head, at the rear near the top. Retighten the clamp screw and recheck the position of the needle point in relation to the left side of looper opening. Loosen needle carrier clamp screw (C, Fig.3) and rotate carrier as required for above setting. The needle carrier should be set front to back so the side of the needle is flush to .003 inch (.076 mm) from vertical wall at the right side of presser foot. It may be necessary to slightly retard or advance the above adjustments to obtain desired results.

CAUTION: When adjusting the needle eccentric ball stud, make sure that it is seated against the needle shaft crank.

## LOOPER TIMING AND ADJUSTMENT

Insert the looper into its carrier so that the flat on its shank corresponds with flat in carrier and allow 1/64 inch (.4mm) clearance between looper shoulder and end of looper carrier.

## LOOPER TIMING AND ADJUSTMENT (Continued)

In the left end of the mainshaft (A, Fig.6) is a "V" groove and on the looper crank (B) is a timing mark.

Turn the handwheel in operating direction until the "V" groove in the mainshaft is at bottom. Loosen two screws (A, Fig.7) in the looper crank (B) and position the crank so that the timing mark lines up with the right edge of the "V" groove in the mainshaft (see Fig.6).

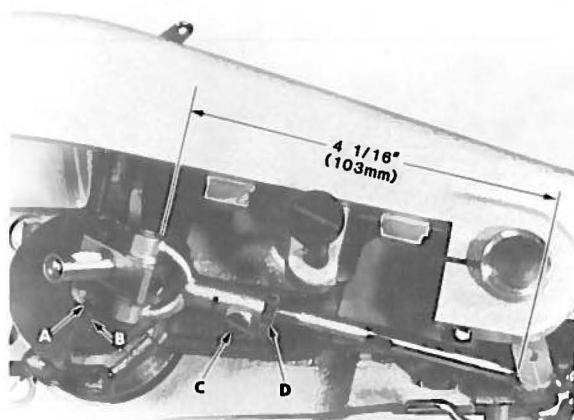

Fig. 6

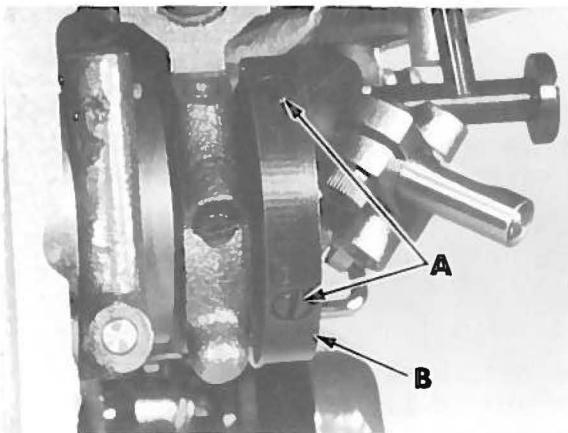

Fig. 7

Hold crank (B, Fig.7) against needle drive eccentric and tighten screws in looper crank securely.

The approximate distance from the back side of the front ball to the near edge of the inside of link pin should be 4 1/16 inches (103.2mm). See Fig.6. This is merely an approximate setting.

Fig. 8

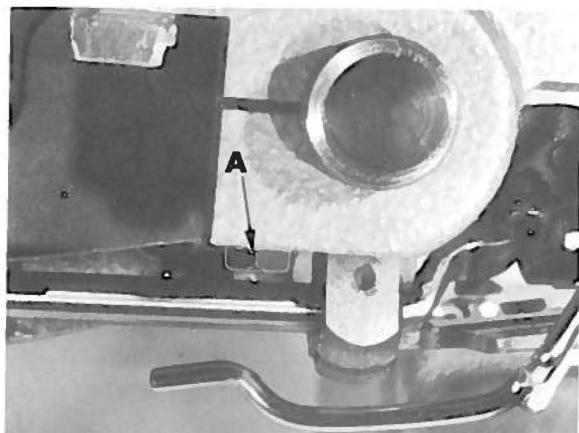

Fig. 9

If adjustment is required, loosen clamp screw (A, Fig.9) as viewed from left end of machine and move looper eccentric sleeve (B, Fig.8) left or right, then tighten clamp screw. Rotate handwheel in operating direction and check the distance between the short prong of looper and chaining finger on presser foot. There should be approximately 1/32 inch (.8mm) clearance.

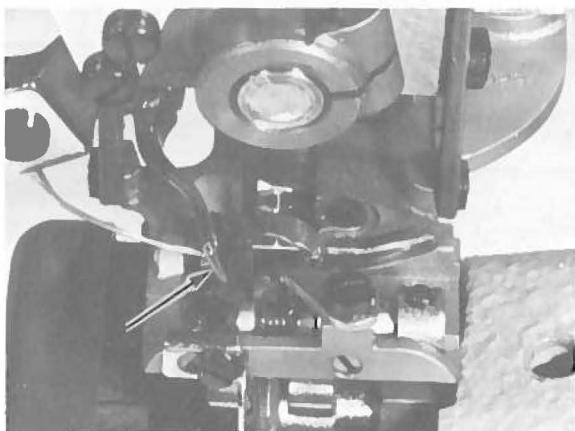

Fig. 10

#### LOOPER TIMING AND ADJUSTMENT (Continued)

Rotate handwheel in operating direction and make sure the short prong of looper does not strike looper opening in presser foot, (see Fig.10).

If adjustment is required, loosen clamp screw (A,Fig.9) and move looper sleeve (B,Fig.8) to the left the LEAST AMOUNT required, until this condition is obtained and tighten clamp screw. Rotate the handwheel in operating direction and check to ensure the needle does not strike the crotch of looper (see Fig.11).

If adjustment is required, loosen set screw (A,Fig.7) and turn crank (B) slightly as required until this condition is obtained.

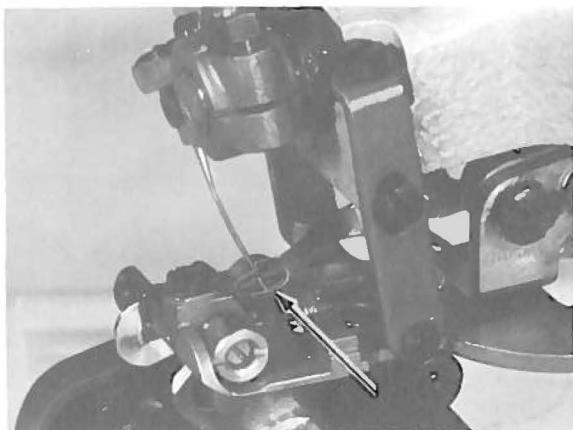

Fig. 11

Rotate handwheel in operating direction to ensure needle enters approximately equal distance between the prongs of looper (see Fig.11). If adjustment is required, loosen clamp screw (A,Fig.9) and carefully rotate looper eccentric sleeve (B,Fig.8) until this condition is obtained, being careful not to move eccentric sleeve left or right. Tighten clamp screw securely. NOTE: "LOOPER TIMING AND ADJUSTMENT" has been a coordination of settings basically involving looper carrier, driving crank and looper eccentric sleeve. Different materials or different threads used may require a slight variation of settings. If necessary, only roll the looper to the needle slightly by loosening screw (C,Fig.6) and nut (D) permitting rotation of looper carrier to achieve desired conditions... retighten nut and screw.

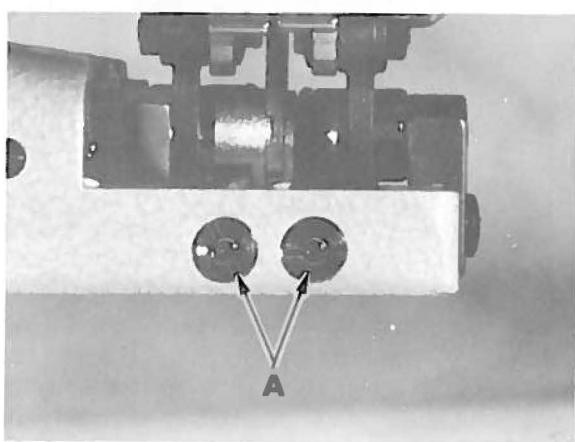

Fig. 12

#### SETTING FEED PLATES

Pressure on the feed plates is regulated by nuts (A,Fig.12). Turning them counterclockwise increases the tension and turning them clockwise acts the reverse, as viewed in (Fig.12). Set spring pressure so screw is approximately 1/16 inch (1.6mm) from inside edge of nut. The feed plates must drop uniformly when knee shaft is depressed.

## SETTING FEED PLATES (Continued)

If adjustment is required, loosen set screw (A, Fig.13) in front of cylinder and move depressing feed plate shaft (B) so there is approximately  $1/32$  inch (.8mm) clearance between feed plates and depressing shaft. Tighten set screw securely.

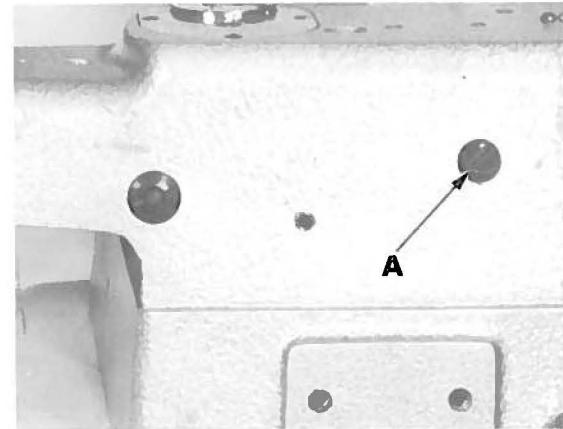

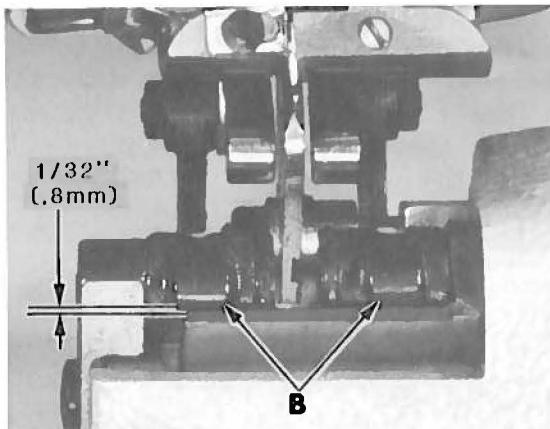

Fig. 13

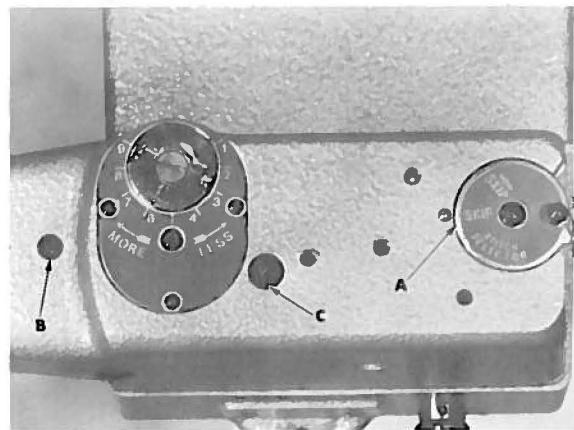

Fig. 14

If adjustment is required, loosen set screw (B) which locks pivot bearing (C) and release tension on cradle spring (A, Fig.17) by turning nut (A, Fig.16) counterclockwise. Adjust pivot bearing (C, Fig.15) (B, Fig.17) as required to remove shake, but ridge former shaft cradle (C, Fig.17) MUST NOT BIND. Tighten set screw (B, Fig.15) securely. Apply pressure on cradle spring (A, Fig.17) by turning nut (A, Fig.16) clockwise until screw (B) is flush with screwdriver slots in nut.

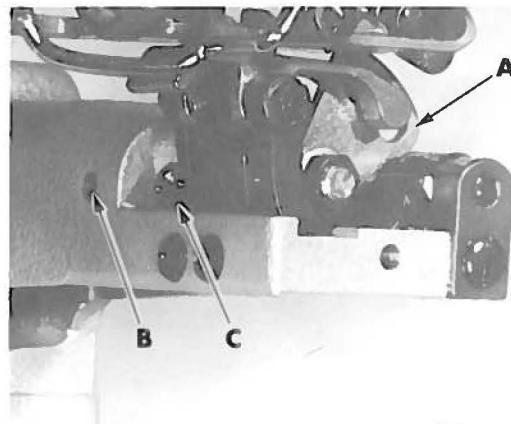

Fig. 15

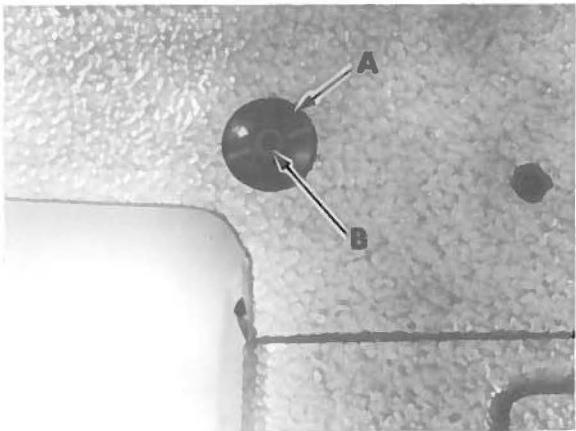

Fig. 16

Ridge former regulator (A, Fig.18) controls the amount of needle penetration at maximum penetration (9 on the dial). The needle should graze the ridge former disc enough to note the needle lifting off of the needle guide of presser foot. If adjustment is required. Remove locking screw (B) and turn adjusting screw (located beneath same) as required. Replace and tighten locking screw (B). The needle moving from left to right should be timed with the ridge former so that when the ridge former has reached its farthest travel to the rear, the point of needle is over the center of the width of the ridge former.

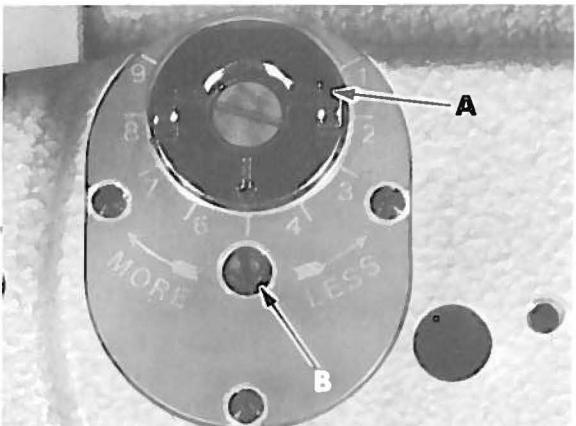

Fig. 18

Loosen screw (C, Fig.14) and set ridge former disc the required distance past needle as viewed in (Fig.19). Hold ridge former disc in this position and to the right while tightening screw (B) securely.

#### SETTING RIDGE FORMER (Continued)

If ridge former disc is not centered in cloth opening of presser foot, loosen screw (B, Fig.14) in collar (D, Fig.17) and screw (C, Fig.14) in ridge former shaft lever, allowing ridge former shaft (E, Fig.17) to be moved laterally to position ridge former disc as required. While holding ridge former disc in position, thrust collar (D) against ridge former shaft cradle (C) and tighten screw (B, Fig.14) securely. Temporarily tighten screw (C) in ridge former shaft lever.

(As viewed from bottom of machine)

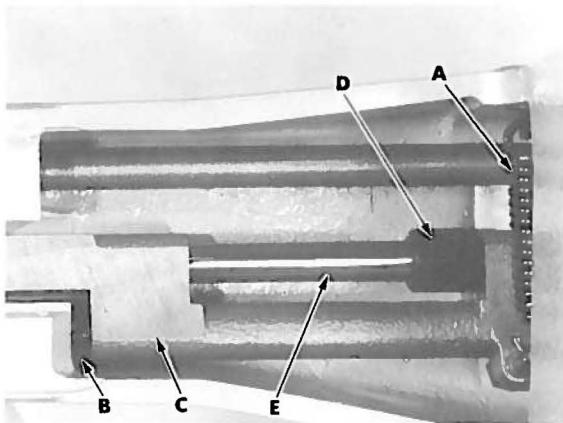

Fig. 17

At this time, the needle should be  $1/16$  inch (1.6mm) from the front of the ridge former disc. If adjustment is required rotate handwheel in operating direction until the point of needle is over the center of the width of ridge former disc.

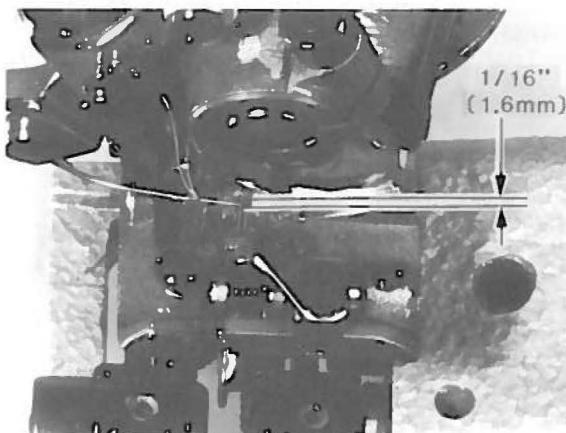

Fig. 19

## SETTING FEED DOG

As the needle travels from right to left, the feed dog should contact feed plates when point of needle is flush with right side of cloth opening behind needle. Feed dog should depress feed plates approximately the depth of one full tooth. The feed dog is adjusted by means of two screws (A, Fig. 20) on the right side of the head. The slot in eccentric stud (B) should be vertical when the feed bar is all the way towards the operator and the punch marks at the end of the slot in stud should be up.

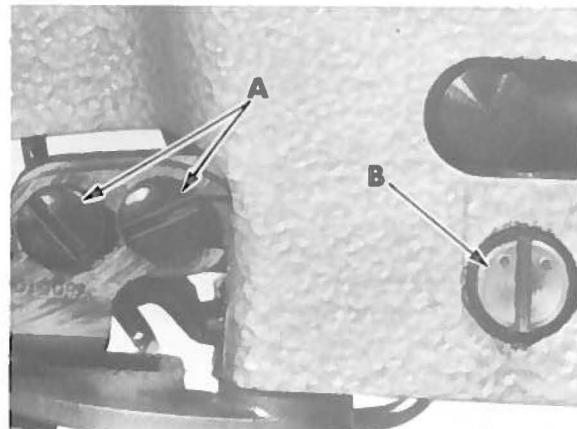

Fig. 20

To position stud, loosen clamp screw (A, Fig. 21) and position stud as required, retighten clamp screw. It may be necessary to rotate the punch marks slightly, (in stud) to obtain a full tooth depth for shorter numbers of stitches.

**CAUTION:** Feed dog must not graze looper, chaining finger or the back of the feed dog slot in presser foot.

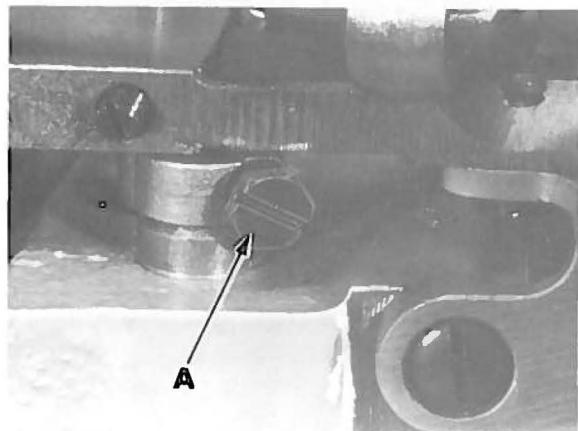

Fig. 21

## STITCH LENGTH

Press plunger (A, Fig. 22) in firmly, while holding plunger in, turn handwheel in operating direction until stitch regulating finger is felt to drop into the slot of feed regulator. Continuing to hold the plunger in, turn handwheel in operating direction to increase the stitch length or in opposite direction to decrease the stitch length. Observe the white timing mark on the handwheel with the numbers on the upper belt guard and graduation plate to obtain the correct stitch length then release knob.

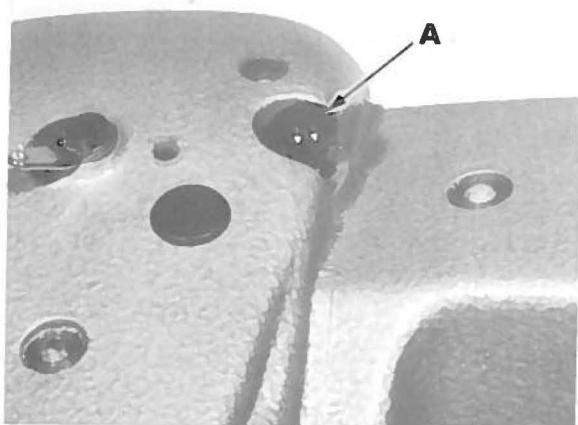

Fig. 22

## CLOTH RETAINER

Cloth retainer (A, Fig. 23) should be centered over ridge former disc and set as close as possible to the needle. Right to left adjustment can be accomplished by loosening set screw (B), repositioning bushing (C), as required and retighten set screw. Front to rear adjustment can be accomplished by loosening set screw (D), turn eccentric pin (E) as required and retighten set screw.

When sewing on material, the cloth retainer must hold material firmly against ridge former disc... otherwise skip-stitching may occur. More or less pressure can be applied to the cloth retainer by loosening set screw (B, Fig. 23) and rotate bushing (C) as required, being careful to keep cloth retainer centered over ridge former disc and retighten set screw.

NOTE: Recheck cloth retainer setting to needle.

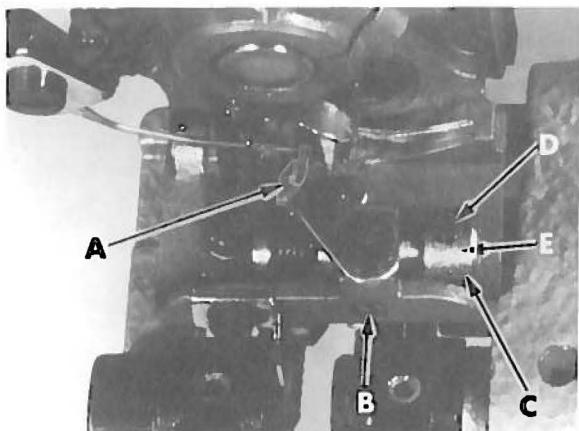

Fig. 23

Numbers in the first column are reference numbers only and merely indicate the position of that part in the illustration. Reference numbers should never be used in ordering parts. Always use the part number listed in the second column.

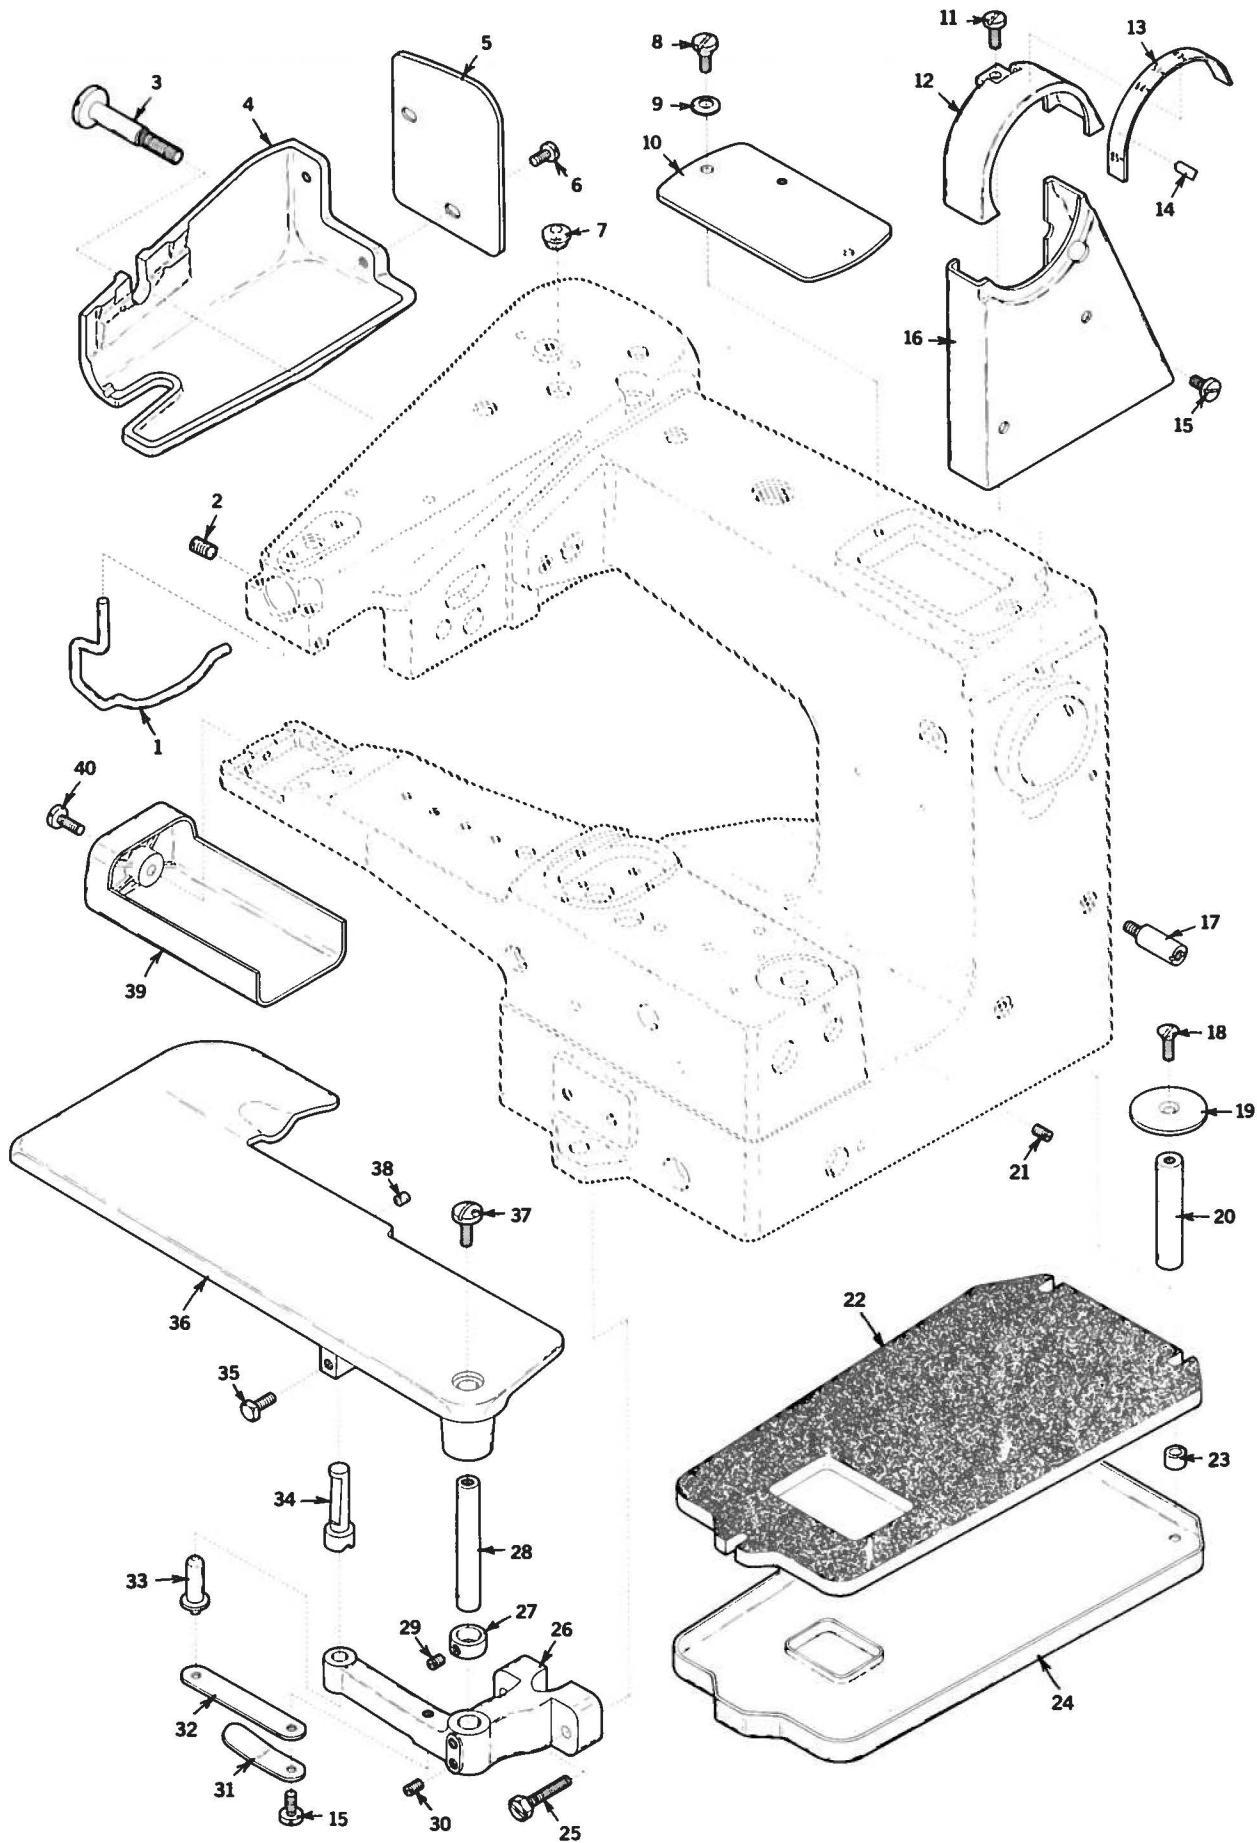

Component parts of sub-assemblies which can be furnished for repairs are indicated by indenting their descriptions under the description of the main sub-assembly.

At the back of the book will be found a numerical index of all the parts shown in this book. This will facilitate locating the illustration and description when only the part number is known.

## TERMS

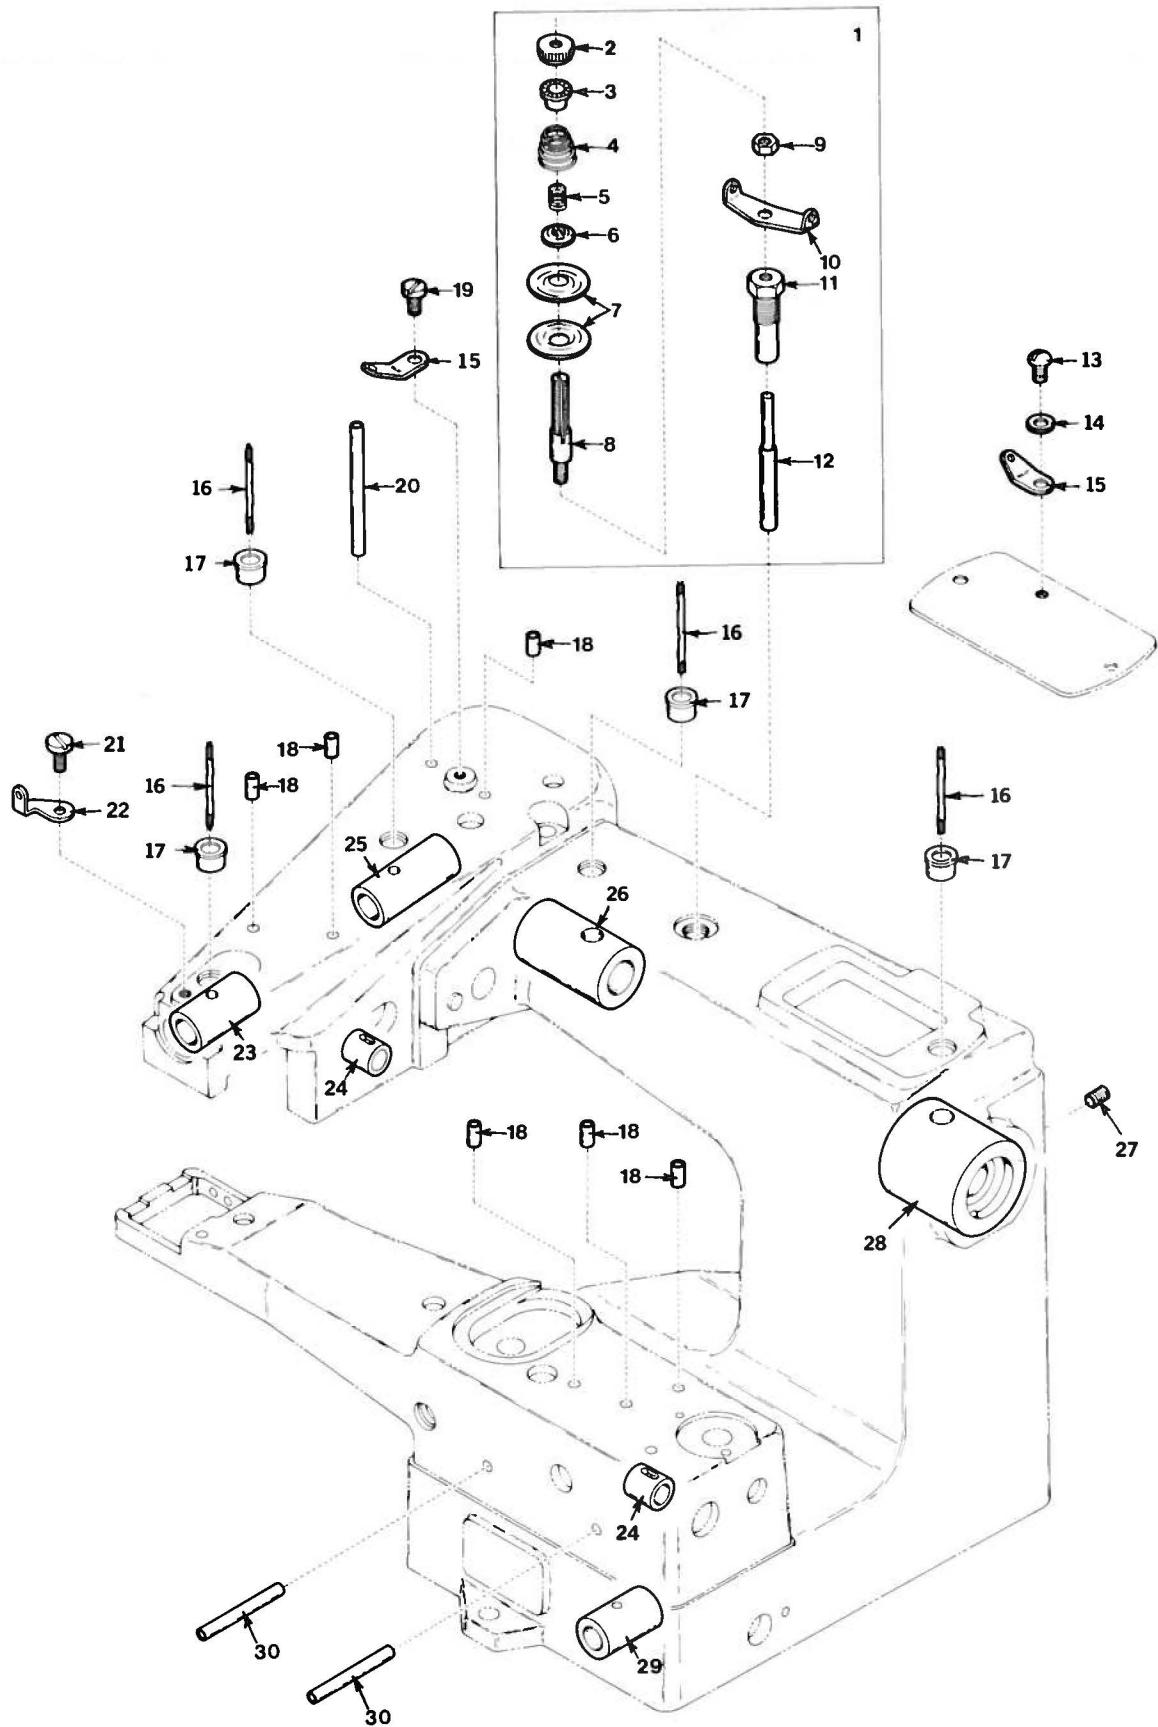

Prices are net cash and subject to change without notice. All shipments are forwarded F.O.B. shipping point. Parcel Post shipments are insured unless otherwise directed. A charge is made to cover postage and insurance.
