

PARTS AND SERVICE MANUAL

WOLF®

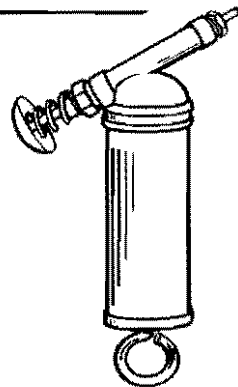

PUP "IV" PUP "V"

INSTALLATION • OPERATING MAINTENANCE INSTRUCTIONS AND PARTS LIST

Reprint September 2008

CAUTION

TO PREVENT DAMAGE to your PUP it is necessary to lubricate it after every four (4) hours of use. A Grease Gun is NOT included with this machine. If you do not possess this type of gun, please order **Grease Gun #2548100.**

Nozzle is included

WOLF PUP "IV" & "V" MAINTENANCE & OPERATING INSTRUCTIONS

WARNING

This is a hazardous type of machinery and should be used with care. Always disconnect electrical or air connector before performing repairs, adjustments or maintenance. Be sure all electrical machines are properly grounded. Never allow any part of your person or any other person to be in the path of the blade when the machine is in service. Only grip machine by the handles provided. For personal safety the operator should remove all loose fitting jewelry, shouldn't wear loose or baggy fitting clothing and persons with long hair should cover or pull it back.

LUBRICATION

It is necessary to lubricate the gears of the PUP and also the backside of the blade. To lubricate blade, apply oil through the hole in side of the cutting head. To grease knife gear, apply grease through the fitting provided at the front of the cutting head. KNIFE GEAR SHOULD BE GREASED AFTER EVERY FOUR HOURS OF USE TO INSURE PROPER LIFE OF THE GEAR.

TO MAINTAIN BEST CUTTING PERFORMANCE

To maintain top performance, replace the knife on the PUP machine as the knife starts to become round and the blades' corners begin to wear away. The PUP will cut best when the corners of the knife are maintained as definite angles with little or no rounding. When the knife is used with a worn blade, the cutting edge will make contact further back on the carbide insert in the shoe and start uneven wear. This causes a loss of the scissor action and almost all cutting power is lost.

TO REMOVE AND REPLACE BLADE

To remove blade, take out the grinder bracket screw that holds the bracket to the head. After grinder bracket is removed, use the pin wrench, supplied with the machine, and remove the knife lock nut. The knife can then be removed. Before replacing the grinder housing, be sure that the grinding wheel is clean. When grinding wheel is worn, replace it. This will save knife blade replacement and keep cutting at top performance.

TO REPLACE GRINDING WHEEL

Remove grinder housing from machine, then loosen set screw in grinder knob and remove from shaft. Next remove #1216193 - snap ring from end of wheel shaft and take off worn out grinding wheel.

Lubricate shaft on new wheel, then replace snap ring and knob in grinder housing. Check to make sure wheel rotates freely. Remount grinder housing to head.

Sharpen knife to a good keen edge on the corners only. If any additional repairs or problems are encountered, it would be advisable to return the machine to the factory for repairs.

For best results use only genuine Wolf knife blades and parts.

TO USE WITHOUT FOOTPLATE

For more intricate types of trimming it may be desirable to use the machine without the small footplate provided. In order to remove this footplate, use small wrench to loosen screws at the side of the plate. Keep knife properly adjusted and sharp for best results in cutting.

ELECTRIC MODEL—MAINTENANCE and OPERATION

Operator should use care in operating the machine and not cover the air exhaust holes of the motor with fingers while using the machine. If this is done it will cause the machine to get excessively hot and may burn out the motor. The air inlet holes should be kept clear of lint at all times so that air can get in to cool the motor while running.

DISASSEMBLY OF MOTOR

For replacement of brushes, switch or line wire

Disassemble by removing the 3 small screws around the outside at the front of the motor. This will allow the motor case to be slipped back, off the motor. Caution should be taken when removing this, so as not to force or put too much pressure on the wires. Also see that wires are in proper position when replacing case. When replacing outer housing, be sure that vent holes are open and not covered so that the exhaust air can blow freely from motor.

AIR MODEL INSTALLATION

For top performance, 90 lbs. of air pressure (10 cubic feet per minute) should be supplied for each machine in continuous operation. A filter lubricator and regulator is recommended. These are available from The Wolf Machine Co. for all Air Model PUP installations.

Air handle position may be rotated as desired. Loosen the two screws (#9900123) that hold front head, then rotate to desired position and retighten.

PUP "IV" & "V" PARTS LIST

Part No.	Qty	Description	Part No.	Qty	Description
1107600	1	Male Plug with Guard	2541000	1	Grinder Kit less Housing
1216193	1	Retaining Ring	2542500	1	Grinding Wheel
1221900	1	Bearing	2543000	1	Wear Washer
