SERVICE INSTRUCTIONS

WARNING

This is a hazardous type of machinery and should be used with care. Always disconnect electrical connector before performing repairs, adjustments or maintenance. Be sure machine is properly grounded. Never place hands or any part of your person in the path of the machine when it's in service. Keep the front guard as low as possible during operation and completely down when not in use. For personal safety the operator should remove all loose fitting jewelry, shouldn't wear loose or baggy fitting clothing and persons with long hair should cover or pull it back.

Keep the machine clean and properly adjusted, as this will add to its life and efficiency. When ordering replacement parts be sure to give Part No., description and machine size.

MOTOR ROTATION

Before placing three phase machines in service be sure the knife rotates in a counter-clockwise direction when looking at the nameplate side of the machine. The rotation can be checked by a flash contact at the electrical connector with the switch turned on. To reverse direction, interchange two wires (not ground wire) at electrical connector.

CAUTION Should the machine be run in the wrong direction parts could unscrew and damage machine. Single phase machines always rotate in the proper direction.

LUBRICATION

The grease cup in the standard should be half filled with grease. Use only a good grade of cup grease.

To oil sharpener journals, remove screw in end of bushing shaft and oil. Keep emery free from oil and grease. To do this, remove emery and rub wheels together until they show a good surface, or spray with Keep-M-Kleen solution (Order #2100600).

TO SHARPEN KNIFE

It is most essential that a keen cutting edge be kept on the knife at all times, as this insures clean and easy cutting. To obtain this, the grinding wheels must be kept properly adjusted. Because of the wear of knife and emery wheels, it is necessary to adjust emeries toward the knife to avoid long bevel. Wheels must touch knife evenly. Adjustment is made by releasing screws clamping the threaded journals. The journals can then be turned to the proper position. Care should be taken that the emery wheels do not go too far down on knife. A good bevel of 1/8" makes a good cutting edge. Emeries must spin free at all times.

TO REMOVE KNIFE

To remove knife, place pin in hole through standard. Use knife wrench and turn knife nut to left. When knife wears, move toeplate back so that knife is about 1/16" from end of slot. Be sure to tighten screws that secure toeplate.

TO REMOVE GEAR

To remove knife gear, have knife on gear. Then put pin in knife and standard and loosen grease cap with pin wrench. Remove knife and cap. Then remove screw and washer. The gear can then be lifted off. Be sure not to lose any washers that may be under bearing, as they adjust the mesh of the gears. When replacing, be sure the screw and cap are tight.
