MAIMIN® ROTOSHERE

# INSTRUCTIONS and PARTS LIST

**Edition 3** 

© 1982 H. MAIMIN CO., INC.

### 1. Safety Instructions

- a.) Be sure machine is properly grounded.
- b.) Use correct electrical wiring.
- c.) Keep cutting area clean and well lit.
- d.) Keep visitors away from cutting area.
- e.) Do not use machine in damp or wet location.
- f.) Store machine in dry location.
- g.) Keep machine and Blade sharp for best and safest performance.
- h.) Always disconnect machine when not in use, before servicing, and when changing Blade.
- i.) Remove Knife Key (542) from Knife Lock (536) before starting motor.
- j.) Avoid accidental starting by disconnecting electrical cord before carrying machine and making sure Switch (540) is off before connecting cord.
- k.) Keep hands away from Blade.

### 2. To Start

Your Maimin Rotoshere L has been carefully packed and is ready for use upon removal from the carton. Make sure that the Switch (540) located in the Handle (537) of the machine is in the "off" position. Then connect the machine to an electrical outlet of the same voltage as on the nameplate of the machine by means of the Current Connector (458B). Flip Switch (540) to "on" position to start machine.

### 3. To Cut

Your Rotoshere L is designed to cut light or medium-weight materials from a single ply to multiple plies up to ½ inch (13 mm) in height. The material should be spread smoothly on a flat table and stacked to the desired height. If the material is very light, it is helpful to put a sheet of paper beneath the bottom ply. The shapes to be cut should be marked on the top ply or on a paper pattern laid on the top ply. Always cut the small marked pieces from the large marked pieces for accuracy and convenience.

	519	Sharpener Frame only	30321	Blade 21/2" - High Speed Steel

Always Give Machine SERIAL NUMBER When Ordering Parts.

### 4. To Sharpen

After cutting awhile, the Blade (30301) will become dull and will either "push" the material ahead of it or "pull" the material towards the machine.

To Sharpen the Blade, press down on the Sharpener Handle (524) for about two seconds while the machine is running. Do not press hard enough to slow the Blade. Repeat this operation 3 or 4 times. The Blade should then have a keen cutting edge.

### 5. Blades Available

Normally the regular Rotoshere L Blade (30301) is satisfactory. However, certain hard materials such as fibreglass dull the Blade edge unusually quickly requiring use of a High Speed Steel Blade (30321) which retains its sharpened edge longer.

### 6. To Lubricate Gear

Grease the Gear (530) and Worm (531) every two weeks by turning the cap on the Grease Cup (311G) one-half turn. When the cap is empty, refill it with either Maimin Grease (22028) or Lubriplate 930-AA Grease.

### 7. To Change Blade

Replace the Blade (30301) when it is worn down to approximately 2" (5 cm) in diameter. Unscrew the Knife Lock (536) counter-clockwise with the Knife Key (542) to remove the Blade. Lift the worn Blade from the Gear. Install the new Blade with its printed lettering facing you. Rotate the Blade on the Gear until it is seated into position on the irregularly-shaped shoulder. Replace the Knife Lock, and tighten it clockwise with the Knife Key.

### 8. To Adjust Stones

For cutting most materials, we recommend grinding a bevel width of approximately 1/32" (0,8 mm) on both sides of the Blade. If your Blade does not have an even bevel on both sides, adjust the position of the Stones as follows:

- 1. Loosen the four Screws (520S) on the Sharpener Frame (519).
- 2. Turn the two Adjusting Bushings (528) so that both Stones (525) will strike the Blade simultaneously when the Sharpener Frame is depressed.

- 3. Retighten the four Screws (520S) and check that both Stones strike the Blade at the same time.
- 4. If the Stones touch properly but the bevel is too narrow or too wide, repeat the adjusting procedure. Note that the width of the bevel is increased by moving both stones slightly farther apart and decreased by moving both stones slightly closer together.

**IMPORTANT:** After all adjustments are made, the four Screws (520S) on the Sharpener Frame must be tightened securely.

#### 9. To Remove Gear

To remove the Gear Assembly (530X) for inspection or replacement, first remove the Blade, and then unscrew the Gear Screw (534). It has a left-hand thread and should be loosened by turning in a *clockwise* direction. If the head of the Gear Screw has been broken, the body of the screw can be removed from the back of the Standard (515) with a smaller screwdriver by turning in a clockwise direction. After the Gear Screw has been removed, pull the Gear Assembly off the trunnion shaft. If there is a Washer (531W) behind the Gear, replace it on trunnion shaft before installing Gear.

#### 10. To Clean The Machine

The motor should be blown out with compressed air occasionally to remove lint and dust for more efficient and cooler operation. If the machine stops or slows down from fragments of material collecting in the Gear, remove the Blade and then the Gear. Clean the fragments from the Gear and Standard, and replace the Gear and Blade.

### 11. Trouble-Shooting Guide

If the machine does not operate:

- 1. Check that the Current Connector (458B) is firmly attached to the Terminal Pins (309C) and that the machine is connected to the electrical outlet.
- 2. Check for a defective Switch (540).
- 3. Check for worn Carbon Brushes (511).
- 4. Check for dirt or cloth jammed behind the Blade (30301) or in the Gear (530).

CAUTION: Always Disconnect Machine from Electrical Outlet Before Making Adjustments.

### IMPORTANT SAFETY INSTRUCTIONS

When using your cutting machine, basic safety precautions should always be followed, including the following:

- 1. Read all instructions.
- 2. Use machine only for its intended use as a portable cutting machine.
- 3. Turn machine to "OFF" before connecting or disconnecting power cord.
- 4. Do not install or store this machine in a wet location.
- 5. Keep area around machine free from the accumulation of lint.
- 6. Always disconnect machine from electrical connector when not in use, before servicing, and when changing blades.
- 7. Do not operate machine with a damaged cord or if machine has been dropped. Do not disassemble; take to qualified serviceman for repairs. Incorrect reassembly can cause electric shock when the machine is used.
- 8. Keep visitors away. Do not leave machine unattended while it is connected.
- 9. Keep hands away from blade.
- 10. Be sure machine is properly grounded while in use to protect the operator from electrical shock. Surrounding the Terminal Pins is a Ground Shield which is designed to be used with the Maimin Grounded Connector (#458B). See tag supplied with Connector for wiring instructions.

Use correct electrical wiring.

U.S.A. only

1 phase: Use AWG 16/3 SJ, SJT or SJE

INTERNATIONAL 1P + N + 1: Use  $3 \times 1$ ,  $0 \text{ mm}^2 \text{ CEE}(2)61$ 

DANGER: Improper connection of cord into connector can result in risk of electric shock. Check with a qualified electrician or serviceman if the grounding instructions are not completely understood.

- 11. Keep machine clean and blade sharp for best and safest performance.
- 12. The knife key and other wrenches must be removed from machine before starting motor.
- 13. Keep guards in place and in working order.

### **OPERATING INSTRUCTIONS**

### 1. To Start

Your Maimin Rotoshere 2 has been carefully packed and is ready for use upon removal from the carton. Make sure that the Switch (10717) located in the Handle (10710R) of the machine is in the "off" position. Then connect the machine to an electrical outlet of the same voltage as on the nameplate of the machine by means of the Current Connector (458B). Slide Switch (10717) to "on" position to start machine.

#### 2. To Cut

Your Rotoshere 2 is designed to cut light or medium-weight materials from a single ply to multiple plies up to ½ inch (13 mm) in height. The material should be spread smoothly on a flat table and stacked to the desired height. If the material is very light, it is helpful to put a sheet of paper beneath the bottom ply. The shapes to be cut should be marked on the top ply or on a paper pattern laid on the top ply. Always cut the small marked pieces from the large marked pieces for accuracy and convenience.

### 3. To Sharpen

After cutting awhile, the Blade (30301) will become dull and will either "push" the material ahead of it or "pull" the material towards the machine.

To Sharpen the Blade, press down on the Sharpener Handle (524) for about two seconds while the machine is running. Do not press hard enough to slow the Blade. Repeat this operation 3 or 4 times. The Blade should then have a keen cutting edge.

### 4. Blades Available

Normally the regular Rotoshere 2 Blade (30301) is satisfactory. However, certain hard materials such as fibreglass dull the Blade edge quickly requiring use of a High Speed Steel Blade (30321) which retains its sharpened edge longer.

#### 5. To Lubricate Gear

Grease the Gear (530) and Worm (531A) every two weeks by turning the cap on the Grease Cup (311G) one-half turn. When the cap is empty, refill it with either Maimin Grease (22028) or Lubriplate 930-AA Grease.

### 6. To Change Blade

Replace the Blade (30301) when it is worn down to approximately 2" (5 cm) in diameter. Unscrew the Knife Lock (536) counter-clockwise with the Knife Key (542) to remove the Blade. Lift the worn Blade from the Gear. Install the new Blade with its printed lettering facing you. Rotate the Blade on the Gear until it is seated into position on the irregularly-shaped shoulder. Replace the Knife Lock, and tighten it clockwise with the Knife Key.

### 7. To Adjust Stones

For cutting most materials, we recommend grinding a bevel width of approximately  $\frac{1}{32}$ " (0,8 mm) on both sides of the Blade. If your Blade does not have an even bevel on both sides, adjust the position of the Stones as follows:

- 1. Loosen the four Screws (520S) on the Sharpener Frame (519).
- 2. Turn the two Adjusting Bushings (528) so that both Stones (525) will strike the Blade simultaneously when the Sharpener Frame is depressed.
- Retighten the four Screws (520S) and check that both Stones strike the Blade at the same time.
- 4. If the Stones touch properly but the bevel is too narrow or too wide, repeat the adjusting procedure. Note that the width of the bevel is increased by moving both stones slightly farther apart and decreased by moving both stones slightly closer together.

**IMPORTANT:** After all adjustments are made, the four Screws (520S) on the Sharpener Frame must be tightened securely.

### 8. To Remove Gear

To remove the Gear Assembly (530X) for inspection or replacement, first remove the Blade, and then unscrew the Gear Screw (534). It has a left-hand thread and should be loosened by turning in a *clockwise* direction. If the head of the Gear Screw has been broken, the body of the screw can be removed from the back of the Standard (515E) with a smaller screwdriver by turning in a clockwise direction. After the Gear Screw has been removed, pull the Gear Assembly off the trunnion shaft. If there is a Washer (531W) behind the Gear, replace it on trunnion shaft before installing Gear.

### 9. To Clean The Machine

The motor should be blown out with compressed air occasionally to remove lint and dust for more efficient and cooler operation. If the machine stops or slows down from fragments of material collecting in the Gear, remove the Blade and then the Gear. Clean the fragments from the Gear and Standard, and replace the Gear and Blade.

### 10. Trouble-Shooting Guide

If the machine does not operate:

- 1. Check that the Current Connector (458B) is firmly attached to the Terminal Pins (309C) and that the machine is connected to the electrical outlet.
- 2. Check for a defective Switch (10717).
- 3. Check for worn Carbon Brushes (587).
- 4. Check for dirt or cloth jammed behind the Blade (30301) or in the Gear (530).

CAUTION: Always Disconnect Machine from Electrical Outlet Before Making Adjustments.
